

BlockSign Process Report

Period: July 1, 2025 through August 31, 2025 · Database timezone: UTC/GMT · Aggregated and free of personal data

Registrations	of which SSO	Uploads	uploading customer	Recipients	Signed
20	6	52	16	72	52

Process overview and cycle times					
Process	Cases	Average	Median	P90	Measurement basis / interpretation
Sign + 1st Login → Register	14	not measurable	not measurable	not measurable	14 standard registrations. A first login was not stored separately in 2025, so no reliable cycle time can be calculated.
Signup SSO → SingleSignUp	6	not measurable	not measurable	not measurable	6 SSO registrations, identified through a Google, Microsoft, or Apple ID. Signup and first login occur in one flow, but no separate historical timestamps exist.
Upload	52	not measurable	not measurable	not measurable	52 documents uploaded by 16 customers. documents.created_at is the upload/document creation time; no preceding upload-start timestamp exists.
Upload → Recipient created (invite proxy)	72	80:02:32	0:00:00	0:02:09	Historical proxy because invitations_sent_at is empty for the period. A few very late recipient creations heavily distort the average; median and P90 are more representative.
Upload → Checkout paid (when required)	1	0:07:55	0:07:55	0:07:55	Only one document in the upload cohort has a paid transaction. The sample is too small for a representative checkout benchmark.
1st View → Sign	52	not measurable	not measurable	not measurable	52 recipients signed. The first-view timestamp was not stored separately in 2025, so the exact First View → Sign duration cannot be reconstructed.
Recipient created → Sign (proxy)	52	62:46:56	0:04:09	70:48:39	Proxy for Invite/View → Sign. A recipient can be created before the invitation is sent, so this is not equivalent to a true first-view duration.
Upload → Sign	52	173:35:37	0:06:07	88:19:06	Reliable end-to-end proxy from document creation to signed_at. The average is sensitive to long outliers.
Download	not measurable	not measurable	not measurable	not measurable	No document-linked download event with a usable timestamp exists for 2025. Operational event records begin on September 4, 2026.

Executive summary

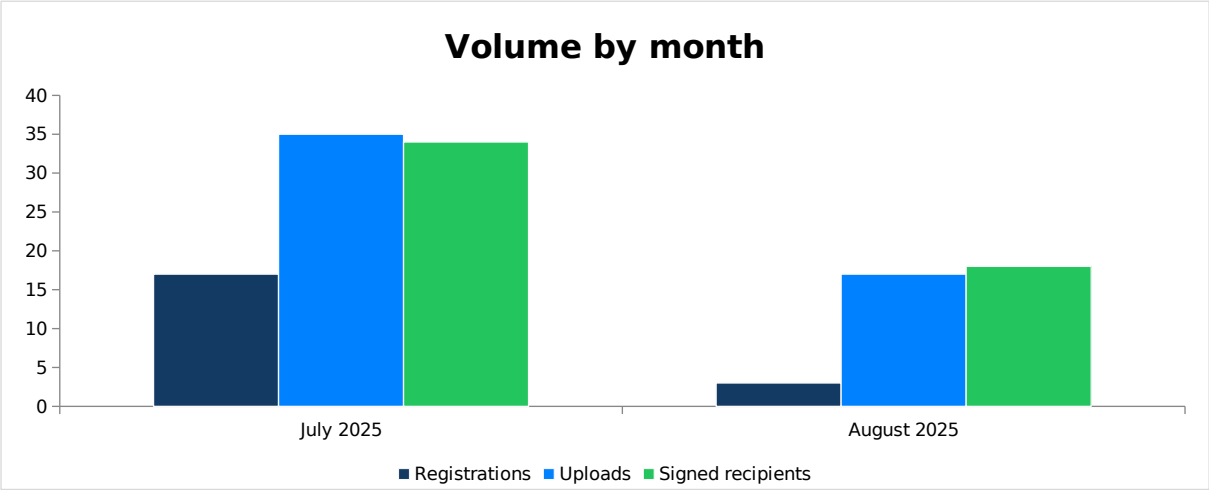

The cohort contains 52 uploads from 16 customers and 72 recipient processes. 52 recipients signed (72.2%). The typical flow was fast: median Upload → Sign was 6:07 minutes, while long outliers raised the average to 7 days 05:35:37.

Important: First Login, First View, and document-linked Download duration cannot be measured exactly for this historical period. The report clearly labels unavailable measures and proxy values.

Monthly comparison

Cohort assignment is based on account or document creation in each month.

Month	Registrations	SSO registrations	Uploads	Uploading customers	Signed recipients	Paid documents
July 2025	17	4	35	12	34	1
August 2025	3	2	17	9	18	0
Total	20	6	52	16	52	1

Methodology and data quality

Definitions, limitations, and interpretation of the metrics.

Topic	Definition / note
Period	Half-open UTC interval: July 1, 2025 00:00:00 through before September 1, 2025 00:00:00. This fully includes August 31.
Document cohort	All documents with documents.created_at in the period. Later invitation, payment, and signing timestamps remain included to preserve complete cycle times.
Registrations	users.created_at in the period. SSO is identified by a Google, Microsoft, or Apple ID; all remaining accounts are classified as standard registrations.
Upload	documents.created_at is a proxy for completed upload/document creation. No upload-start timestamp exists.
Invite	documents.invitations_sent_at is empty for all 52 historical documents. recipients.created_at is therefore used only as a clearly labeled recipient-creation proxy.
Checkout	Earliest paid transaction per document from iamx_user_payments. The cohort contains only one paid document, so the result is not a typical checkout benchmark.
First View	The historical SEEN status has no dedicated timestamp. recipients.updated_at is not reliable as a First View timestamp.
Sign	recipients.signed_at is the reliable endpoint. 52 of 72 recipients in the document cohort have a signing timestamp.
Download	No durable document-linked download event exists for 2025. operational_events contains zero records in the period and begins on September 4, 2026.
Average vs. median	The average is strongly affected by a few long cases. Median represents the middle case; P90 means 90% of cases completed within this duration.
Privacy	The report contains aggregated values only. Names, email addresses, user IDs, and document UUIDs were not exported.
